

STATE SUMMARY: from launcher to policy briefings

Follow stateSummary.ps1 through its Python analysis, generated reports and the State Summary web viewer.

REPORT VIEWS

Issue-first Word report: topic -> states. State-first Word report: state -> topics, with a page break per state.

Both include linked headlines and summaries. The web viewer offers both grouping modes for the same exported stories.

Actual data window

The analysis uses the last 24 hours by published date.
It does not use firstEyes for eligibility.
The 'weekly' filenames do not change this window.

One topic per story

Six scores are calculated; only the top topic is considered.
A below-threshold top score means the story is skipped.
There is no review queue or alternate-topic fallback.

Reading this chart

Solid arrows: processing or an acceptance decision.
Dashed arrows: upstream/viewer inputs or skip branches.
The viewer reads files; it is not launched by PowerShell.
